arteriosclerosis, hyperturicemia and sleep apnea syndrome. The genes (AAZ90631-633) and the proteins (AAY50598-X67600) are used in the genetic diagnosis, prevention and treatment of adipose tissue related diseases. Sequences AAZ90640-51 represent PCR primers amplifying the human adipose tissue genes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to identification of genes and proteins of adipose tissue relating to obesity, particularly complications of visceral obesity including diabetes, hyperlipemia, hypertension, arteriosclerosis, hyperuricemia and sleep apnea syndrome. The genes
                                                                                                                                                                                                                                                                           The invention relates to identification of genes and proteins of adipose
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Adipose tissue; obesity; diabetes; hyperlipemia; hypertension; human; arteriosclerosis; hyperuricemia; sleep apnea syndrome; PCR primer; ss.

The invention relates to an isolated human nucleic acid molecule comprising an allelic variant of a polymorphic region of a 5-lipoxygenase (5-Lo) gene, where the allelic variant comprises one or more nucleotide selected from any of 3, 20 or 21 base pair sequences, given in the selected from any of 3, 20 or 21 base pair sequences, given in the specification, or their complement. The compositions and methods of the present invention are useful for diagnosing and/or prognosing disorders associated with an aberrant inflammatory response such as asthma, bronchitis, anrotides, ulcerative colitis, nephritis, amyloidosis, concentration arthritis, sarcoidosis, scleroderma, lupus, non-allergic rhinitis, polymyositis, Reiter's syndrome, psoriasis, pelvic inflammatory disease, atopic and contact dermatitis. The nucleic acid molecules can also be useful for identifying an individual amongst other individuals from the same species for use in forensic medicine and paternity testing. This polymucleotide sequence represents DNA relating to the human 5-lipoxygenase (5-Lo) gene of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              primer, PCR, polymerase chain reaction, sequencing, walking, complementary extension reaction; low redundancy; universal primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                    New isolated nucleic acid molecule with an allelic variant of a polymorphic region of an 5-LO gene, useful for diagnosing and/or prognosticating disorders associated with an aberrant inflammatory response such as asthma -

```
simultaneous sequencing of restriction enzyme fragment and adjacent region of intact DNA, avoids the need for cloning and requires fewer primers
```

Example 1; Page 23; 50pp; English.

A method for DNA analysis based on a complementary extension reaction using a DNA polymerase, comprises a combination of fragment walking and DNA sequencing. DNA fragments are formed by digestion of DNA with a restriction enzyme and the targeted DNA sequence can be determined directly from the digested DNA fragments. By exploring the overlapping sequence of the determined base sequence, the overlal base sequence of a lengthy DNA can be determined with low redundancy without cloning or subcloning. In addition, the method can be done with commercially existing methods. ANT3221-92 are primers used in determination of the public sequence. Primer extension was carried out using 16 primers AAT73293

The methods can also be employed for diseases where allelic and genetic heterogeneity exist, such as breast cancer, neurofibromatosis, and hereditary non-polyposis colorectal cancer. Identification of functional alleles is necessary for identification of mutations which may be implicated in the disease. Sequences AXX2001-172 represent primers for determining the functional allele profiles of various genes. The primers are specific for genes such as MSH2 gene, MLH1 gene, BRCA1 gene,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This invention describes a novel recognition system comprising at least region A with a defined structure adjacent to a region B with a randomized structure. The recognition system is useful for screening, identifying, or characterizing at least 1 component of a sample, especially nucleic acids and/or proteins, and for screening for and/or identifying cellular or synthetic binding partners, preferably proteins, peptides, nucleic acids, chemical agents, preferably organic compounds, pharmaceuticals, plant protection agents, toxins, venoms, carcinogens, processes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Recognition system, e.g. for identifying nucleic acids, comprises at least one recognition unit comprising a region with a defined structure adjacent to a region with a randomized structure -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Recognition system; screening; identification; pharmaceutical; toxin;

                                                                                                                                                                                                                                                                                                                                                                                                              δ
```

```
This invention describes a novel recognition system comprising at least 1 recognition unit bound to a support, each recognition unit comprising integion A with a defined structure adjacent to a region B with a randomized structure. The recognition system is useful for screening, identifying, or characterizing at least 1 component of a sample, especially nucleic acids and/or proteins, and for screening for and/or identifying cellular or synthetic binding partners, preferably proteins, peptides, nucleic acids, chemical agents, preferably organic compounds, pharmaceuticals, plant protection agents, toxins, venoms, carcinogens, teratogens, herbicides, fungicides or pesticides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Recognition system, e.g. for identifying nucleic acids, comprises at least one recognition unit comprising a region with a defined structure adjacent to a region with a randomized structure -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             0
                                                                                                                                                                                                                                                                                                                                      This invention describes a novel recognition system comprising at least 1 recognition unit bound to a support, each recognition unit comprising irregion A with a defined structure adjacent to a region B with a randomized structure. The recognition system is useful for screening, identifying, or characterizing at least 1 component of a sample, especially nucleic acids and/or proteins, and for screening for and/or identifying cellular or synthetic binding partners, preferably proteins, peptides, nucleic acids, chemical agents, preferably organic compounds, pharmaceuticals, plant protection agents, toxins, venoms, carcinogens, teratogens, herbicides or pesticides.
                                                                                                                                                                                                                                                            Recognition system, e.g. for identifying nucleic acids, comprises at least one recognition unit comprising a region with a defined structure adjacent to a region with a randomized structure.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Recognition system; screening; identification; pharmaceutical; toxin; plant protection agent; toxin; venom; carcinogen; venom; teratogen; herbicide; fungicide; pesticide; beta-actin; human; ss.

```
This invention describes a novel recognition system comprising at least 1 recognition unit bound to a support, each recognition unit comprising region A with a defined structure adjacent to a region B with a randomized structure. The recognition system is useful for screening, identifying, or characterizing at least 1 component of a sample, especially nucleic acids and/or proteins, and for screening for and/or identifying cellular or synthetic binding partners, preferably proteins, peptides, nucleic acids, chemical agents, preferably organic compounds, pharmaccuticals, plant protection agents, toxins, venoms, carcinogens, teratogens, herbicides or pesticides.
                                                                          Recognition system, e.g. for identifying nucleic acids, comprises at least one recognition unit comprising a region with a defined structure adjacent to a region with a randomized structure -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This invention describes a novel recognition system comprising at least 1 recognition unit bound to a support, each recognition unit comprising region A with a defined structure adjacent to a region B with a randomized structure. The recognition system is useful for screening,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Recognition system, e.g. for identifying nucleic acids, comprises at least one recognition unit comprising a region with a defined structure adjacent to a region with a randomized structure -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Recognition system; screening; identification; pharmaceutical; toxin; plant protection agent; toxin; venom; carcinogen; venom; teratogen; herbicide; fungicide; pesticide; beta-actin; human; ss.

The recognition system is useful for screening, identifying, or characterizing at least I component of a sample, especially nucleic acids and/or proteins, and for screening for and/or identifying cellular or synthetic binding partners, preferably proteins, peptides, nucleic acids, chemical agents, preferably organic compounds, pharmaceuticals, plant protection agents, toxins, venoms, carcinogens, teratogens, herbicides or pesticides.
identifying, or characterizing at least 1 component of a sample, especially nucleic acids and/or proteins, and for screening for and/or identifying cellular or synthetic binding partners, preferably proteins, peptides, nucleic acids, chemical agents, preferably organic compounds, pharmaceuticals, plant protection agents, toxins, venoms, carcinogens, teratogens, herbicides, fungicides or pesticides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Recognition system, e.g. for identifying nucleic acids, comprises at least one recognition unit comprising a region with a defined structure adjacent to a region with a randomized structure -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Recognition system; screening; identification; pharmaceutical; toxin; plant protection agent; toxin; venom; carcinogen; venom; teratogen; herbicide; fungicide; pesticide; beta-actin; human; ss.

This invention describes a novel recognition system comprising at least I recognition unit bound to a support, each recognition unit comprising region A with a defined structure adjacent to a region B with a randomized structure. The recognition system is useful for screening, identifying, or characterizing at least 1 component of a sample, especially nucleic acids and/or proteins, and for screening for and/or identifying cellular or synthetic binding partners, preferably proteins, peptides, nucleic acids, chemical agents, preferably organic compounds, pharmaccuticals, plant protection agents, toxins, venoms, carcinogens, teratogens, herbicides, fungicides or pesticides.
                                                     Recognition system, e.g. for identifying nucleic acids, comprises at least one recognition unit comprising a region with a defined structure adjacent to a region with a randomized structure.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Recognition system, e.g. for identifying nucleic acids, comprises at least one recognition unit comprising a region with a defined structure adjacent to a region with a randomized structure.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This invention describes a novel recognition system comprising at least I recognition unit bound to a support, each recognition unit comprising region A with a defined structure adjacent to a region B with a randomized structure.                                                                                                                                                                                                                                                                                                                                                                                                                          comprising a
                                                                                                                                                                                                                                                                                                                                                                                            This invention describes a novel recognition system comprising at least 1 recognition unit bound to a support, each recognition unit comprising region A with a defined structure adjacent to a region B with a randomized structure. The recognition system is useful for screening, identifying, or characterizing at least 1 component of a sample, especially nucleic acids and/or proteins, and for screening for and/or identifying cellular or synthetic binding partners, preferably proteins, peptides, nucleic acids, chemical agents, preferably organic compounds, pharmaccuticals, plant protection agents, toxins, venoms, carcinogens, teratogens, herbicides, fungicides or pesticides.
                                                                                                                                                                                                                                                                                                Recognition system, e.g. for identifying nucleic acids, comprises at least one recognition unit comprising a region with a defined structure adjacent to a region with a randomized structure.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Recognition system; screening; identification; pharmaceutical; toxin;

The method comprises detecting a methylated UpG-containing glutathione-S-transferase (GST) nucleic acid (1) in a hepatic specimen or a biological fluid, where a methylated GST nucleic acid is indicative of a hepatic cell proliferative disorder. The method can be used to diagnose hepatic cell proliferative disorder. The method can be used to diagnose hepaticallular carcinoma, and to monitor progress of its treatment. Increasing the level of GST is useful in the treatment of liver cancer, in humans or animals. The method can detect the early stages of tumourigenesis in liver cells simply. The present sequence represents a PCR primer which is used in the amplification of the human glutathione S-transferase pig gene (GSTP) promoter in an example from the present invention for mapping somatic GSTPL CpG island but hyperethylation changes by genomic sequencing after bisulfite
identifying cellular or synthetic binding partners, preferably proteins, peptides, nucleic acids, chemical agents, preferably organic compounds, pharmaceuticals, plant protection agents, toxins, venoms, carcinogens, teratogens, herbicides, fungicides or pesticides.

The present invention relates to genes located on the X-chromosome of mammals. These genes are specifically expressed in haploid cells of the testis and encoded amino acid sequences having homology with the amino acid sequence encoded by drosophila germ cell less (gcl) gene. Sequences of the invention are used for gene diagnosis, discrimination of sex, separation of sperm, infertility treatment and chromosomal manipulation, especially in livestock. They are also used in gene therapy. The present DNA sequence is a PCR primer which is used for the identification of genes by differential display method.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New X-chromosome gene expressed in haploid cells of the testis, useful for gene diagnosis, discrimination of sex, separation of sperm, infertility treatment and chromosomal manipulation -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence is that of a perfectly matched target sequence for a molecular beacon comprising an oligonucleotide probe (see ABIS7066) covalently attached at the 3' end to fluorescent dye and at the 5' end to a nanoparticle. In the native state, the probe forms a hairpin conformation with hybridised termini. The probe forms a hairpin conformation with hybridised termini. The probe forms a hairpin conformation with hybridised termini. The proximity of the fluorophore and quencher (gold nanoparticle) in the molecular beacon results in little or no detectable fluorescence. Upon hybridisation of the central complementary stretch of the probe to a target sequence, such as the present sequence, the hairpin undergoes a conformational change resulting in an increase in fluorescence, the extent of which is proportional to the amount of target sequence present: Single mismatches can be detected. The invention relates generally to the use of metal surface quenchers such as particles or films for high sensitivity surface quenchers such as particles or films for high sensitivity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sensitively detecting proximity changes in a system that utilizes an interacting fluorophore and quencher, for high sensitivity applications, involves utilizing a metal surface as quencher
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
Molecular beacon; fluorophore; nanoparticle; nucleic acid detection;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Glucose transporter; GLUT10; insulin; chromosome 20012-13.3; human; glucose metabolism; single strand conformational polymorphism; PCR; type 2 diabetes; SSCP; primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a novel glucose transporter gene and protein, designated GLUTIO. GLUT 10 is an insulin-responsive glucose transporter gene located in the type 2 diabetes linked region of chromosome 20012-13.3. The GLUT 10 polypeptide can be expressed by standard recombinant methodology. The GLUT 10 glucose transporter gene and protein are useful for studying and analysing biological processes of both glucose metabolism and type 2 diabetes. These are also useful in drug screening techniques, especially for screening modulators of glucose transporter activity or compounds having the ability to be transported across the cell membranes. Sequences ABL58290-315 represent primers specific for the various regions of the human GLUT 10 glucose transporter gene. Used in single strand conformational polymorphism (SSCP) analysis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; K-ras; PCR primer; probe; capture probe; mutation detection; ligase detection reaction; LDR; p53; BRCA1; BRCA2; infectious disease; infection; 21 hydroxylase deficiency; Turner Syndrome; obesity; cancer; oncogene; tumour suppressor; human papillomavirus; forensic; environmental monitoring; food industry; feed industry; ss.

The present invention describes a method (M1) for designing capture of ignorucleotide probes (I) for use on a support to which complementary oligonucleotide probes (II) will hybridise with little mismatch, where coligonucleotide probes (II) will hybridise with little mismatch, where coligonucleotide probes (II) will hybridise with little mismatch, where coligonucleotide probes (II) will hybridise with little mismatch, where coligonucleotide is useful managed. The method is useful infectious agents and coling infectious agents and coling infectious agents and parasitic infectious agents of selected from Onchovarva volvulus, Entamobba histolytica and Dracunculus selected from Onchovarva volvulus, Entamobba histolytica and Dracunculus as 21 hydroxylase deficiency, Turner Syndrome and obesity defects.

Comedinesis. The method is also useful for detecting genetic diseases such as 21 hydroxylase deficiency, Turner Syndrome and obesity defects.

Concer is specifically associated with a gene selected from BRCAl gene, cancer is specifically associated with a gene selected from BRCAl gene, concer is specifically associated with a gene selected from BRCAl gene, concer is specifically associated with a gene selected from BRCAl gene, concerns and infrared microscope and infrared microscope and infrared microscope) the support at the confident of paticical x sites and identifying if ligation of the oligonucleotide probesed to presence or absence of the target uncleotide sequences. The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various polymorphic sites within the human thrombospondin 1 and thrombospondin 4 genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thromboembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also useful in forensics, paternity testing, genetic analysis and phenotype correlations to diseases. The present sequence is an example of one of
                                                                                                                                                                                                  McCarthy JJ;

Isolated nucleic acid molecules having polymorphisms in known human genes e.g. cytochrome p450 and cathepsin S useful as genetic linkage markers for locating, identifying and characterizing the genes responsible for disorder-related traits

Example 13; Page 123; 714pp; English

This invention relates to the sequence of an isolated mucleic acid molecule comprising at least one base variation from that of a known human cytochrome P450 A1 (CP4501A1), advancemented P50 A2 (CP4501A2), advancemented P50 A2 (CP4501A2), advancemented P50 A2 (CP4501A2), advanced P Polymorphic sequences in ADREL or CHMR2 are used to cancer for altered cardiovascular function, in COX2 for altered susceptibility to colorectal tumours, in DBI or CHMR1 for altered central nervous system function, in FLAP and HNMT for altered pulmonary, immunological or haematological function, in KLK2 for altered pulmonary, immunological or the prostate, in LTF for altered immunological or haematological or benchin in CHMR3, CHMR4 or CHMR5 for altered central and peripheral nervous system function. The present sequence represents a PCR primer used to amplify the sequences of the invention.

Isolated nucleic acid molecules having polymorphisms in known human genee e.g. cytochrome p450 and cathepsin S useful as genetic linkage markers for locating, identifying and characterizing the genes responsible for disorder—related traits

Example 13; Page 124; 714pp; English.

This invention relates to the sequence of an isolated nucleic acid molecule comprising at least one base variation from that of a known human cytochrome P450 Al (CYP4501A1), adrenergic receptor betal (ADBR1), cytochrome P450 Ol2E1 (CYP4501A1), adrenergic receptor betal (ADBR1), aryl hydrocarbon (AHR), aryl hydrocarbon receptor nuclear translocator (ARN1), cathepsin S (CTSS), cyclooxgenae 2 (COX2), diazepam binding inhibitor (DBI), epoxide hydroxylase 2 (ERM2), 5-lipoxygenae activating protein (FLAP), glutathione-S-transferase 12 (GST12), histanine-N-methyl transferase (HNMT), Kallikrein 2) KAK2, nicotinamide-N-methyl transferase (HNMT), NDPH quinone oxidoreductase 2 (NO22), sulfotransferase thermolabile (STM), UDP-glucuronosyl transferase 20 (UGT2B1), unltidrug resistance (UGT2B15), uroxinase receptor (UGT2B1), multidrug resistance (UMR1), lactotransferrin (LTF), multidrug resistance associated (UMRN1), chann nuclear receptor (NRI12), or acetylcholine muscarinic receptor 1, 2, 3, 4, or 5 (CHMR1, CHMR2, CHMR3, CHMR3, or CHMR5) sequence. The polymorphism in the human genes cited in the human genes cited in the human genes cited in the human genes of the difference of the polymorphism in the human genes cited in the content of the companion of the content of the conten characterising the genes that are responsible for specific traits within the genome and eventually identifying the genes responsible for a variety of disorder-related traits as a result of their e.g., overexpression, constitutive expression, mutation or underexpression, which may be used in diagnoshing and/or treating the disorders. The nucleic acid molecules comprising the polymorphic sequences contained

in CYP4501A1, CYPP4501A2, CYP4502E1, ARNT, EPHX2, GST12, NNMT, NQO2, MRI12, STW, UGT2E14, UGT2E15, AHR. MDR1 and/or MDR3 are useful for screening individuals for altered drug metabolism. The polymorphic sequences contained in CYP4501A1, CYPP4501A2, AHR. MDR1 and/or MDR3 may also be used to screen individuals for susceptibility to cancer. Polymorphic sequences in ADRB1 or CHMR2 zer bused to screen for altered cardiovascular function, in CMZ2 for altered susceptibility to cancer. Colorectal tumours, in DBI or CHMR1 for altered central nervous system function, in FLAP and HNMT for altered central nervous system haematological function, in KLZ2 for altered serine proctease activity in the prostate, in LTF for altered immunological or haematological thustion, in KLZ2 for altered serine protease activity in function, in CHMR3, CHMR4 or CHMR5 for altered central and peripheral nervous system function. The present sequence represents a sequencing primer used to sequence the polymorphic genes of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sensitively detecting proximity changes in a system that utilizes an interacting fluorophore and quencher, for high sensitivity applications, involves utilizing a metal surface as quencher
                                                                                                                                                                                                                                                                                                              Gaps

invention, which contain a polymorphic base at position 24 of their nuclectide sequences. AAZ69579 to AAZ77440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficacious responses to and side effects from pharmaceutical agents acting on a disease as well as other

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human biallelic marker upstream amplification primer SEQ ID NO:7402.
probe forms a hairpin conformation with hybridised termini. The proximity of the fluorophore and quencher (gold nanoparticle) in the molecular beacon results in little or no detectable fluorescence. Upon hybridisation of the central complementary stretch of the probe to a target sequence, such as the present sequence, the hairpin undergoes a conformational change resulting in an increase in fluorescence, the extent of which is proportional to the amount of target sequence present. Single mismatches can be detected. The invention relates generally to the use of metal surface quenchers such as particles or films for high sensitivity applications in, for example, detection and diagnostic systems.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 genomic map; haplotype; phenotype; polymorphic base; genotyping;

                                                                                                                                                        This oligomer contains an inverted polarity region formed from an o-xyloso dimer synthon. Residues 13 and 14 are linked via an o-xyloso group (i.e. mucleotides that have xylose sugar linked via the o-xylene ring). The sequence is designed to target the Human interleukin-1 beta gene beginning at nucleotide 7378 and will covalently cross-link to it via the N4N4-ethanocytosine group. See also AAQ20026-Q20029.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Oligomer HUM beta 113 for forming triplex with IL-1 target duplex.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human interleukin - 1 beta gene; herpes simplex; AIDS; modified;

```
The synthetic oligomer is capable of forming a triplex at physiological pH with a purine rich target sequence by coupling into the major groove of the duplex. The specific target sequence of this oligomer is the human interleukin -1 beta gene beginning at nucleotide 7378 contg. a purine rich sequence concd. on one strand of the duplex. The oligomer, and othera like it are useful in a diagnosis and therapy of diseases characterised by specific DNA duplex targets, e.g. HPV; HER, HIV, hepatitis B, herpes, malignant tumours and inflammation. The triple helices form under mild conditions tumours and inflammation. The triple helices form under mild conditions thus assays may be carried out without subjecting the test specimen to harsh conditions. The oligomer contains an inverted polarity region formed from an o-xyloso dimer synthon. The linking gp. is o-xyloso formed from an o-xyloso dimer synthon. The linking may reader to form the dimer synthon. This additional modifications may render the oligomer stable to nuclease activity. The oligomer is able to inhibit gene expression, as verified by in vitro systems. See also AAQ25452-25501 and AAQ3226-448.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New oligomers contg. modified bases - which form a triplex with G-C doublet in a DNA duplex, for treating and diagnosing HIV, hepatitis, herpes, malignancy and inflammation

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       17-APR-1991
  The synthetic oligomer is capable of forming a triplex at physiological pH with a purine rich target sequence by coupling into the major groove of the duplex. The specific target sequence of this oligomer is the human interleukin -1 beta gene beginning at nucleotide 7378 contg. a purine rich sequence concd. on one strand of the duplex. The oligomer, and others like it are useful in diagnosis and therapy of diseases characterised by specific DNA duplex targets, e.g. HPV; HER; HIV, hepatitis B, herpes, malignant tumours and inflammation. The triple helices form under mild conditions tumours and inflammation. The triple helices form of conditions thus assays may be carried out without subjecting the test specimen to harsh conditions. The oligomer contains an inverted polarity region formed from an o-xyloso dimer synthon. The linking gp. is o-xyloso funcleotides have the 3' positions of xylose sugars linked via the o-xylosuchene ring). Two nucleotides are coupled through a xylene residue to form the dimer synthon. This additional modifications may render the bilgomer stable to nuclease activity. The oligomer is able to inhibit gene expression, as verified by in vitro systems.

AAT04915-T04922 are oligonucleotide primers and probes used for the amplification and sequencing of mammalian stem cell factor (SCF).

Non-naturally occuring SCF and C-terminally truncated polypeptides, having amino acid sequences sufficiently duplicative of naturally courring SCF, stimulate growth of primitive progenitors such as haematopoietic progenitor cells, neural stem cells and primordial germ stem cells. The peptides can be used in a composition for reating leucopenia, anaemia or thrombocytopenia, for enhancing engraftment of bone marrow during transplantation or for bone marrow recovery after chemotherapy or radiation-induced bone marrow appasia nerve damage, infertility, intestinal damage or myelopoiniferative disorders. Antibodies may be raised against the peptides for use in the treatment of AIDS and severe combined immunodeficiency (SCID) states alone or in combination with other factors such as IL-7.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New stem cell factor polypeptide(s) - for stimulating the growth of primitive progenitor cells, esp. for treating disorders involving blood cells
                                                                        Mammalian stem cell factor (SCF) cDNA oligonucleotide primer 220-3.
                                                                                                          Stem cell factor; progenitor; haematopoiesis; SCF; anaemia;

See amplification and sequencing of mammalian stem cell factor (GCF).

Non-naturally occuring SCF and C-terminally truncated polypeptides, having amino acid sequences sufficiently duplicative of naturally occurring SCF, stimulate growth of primitive progenitors such as haematopoietic progenitor cells, neural stem cells and primordial germ stem cells. The peptides can be used in a composition for treating leucopenia, anaemia or thrombocytopenia, for enhancial engraftment of bone marrow during transplantation or for bone marrow or myelosuppression. They can also be used for treating neoplasia, nerve damage, infertlilty, intestinal damage or myeloproliferative disorders. Antibodies may be raised against the peptides for use in the treatment of AIDS and severe combined immunodeficiency (SCID) states alone or in combination with other factors such as IL-7.

The sequences represented by, AAQ90402-15 are synthetic DNA probes containing 5' amino termini. The sequences shown in AAQ90390-401 are synthetic DNA probes with 3' ribonucleoside termini. These sequences were specific for the polymorphisms of HLA gene dQs. The sequences were specific for the polymorphisms of HLA gene dQs. The sequences were specific for the polymorphisms of HLA gene dQs. The sequences were electronic device of the invention. This is a self-addressable electronic device (SAED) that can be used to carry out multi-step and multiplex reactions, such as nucleic acid hybridisations. The advantages of this method are that these reactions can be carried out with complete and precise electronic control, and that the rate, specificity and sensitivity of these reactions are greatly improved at
                                                                                                    aminolink2 Thymine; allows binding to any
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                           New self-addressable electronic devices - used for multi-step and multiplex reactions such as DNA hybridisation(s), clinical diagnostics and bio:polymer synthesis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Alpha-anomeric oligonucleotide ligand 1803 for oestradiol hapten.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Oligonucleotide ligand; steroid hormone; hapten; immobilisation; immunodetection; estradiol; alpha-anomer; ss.

A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-075788) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) dispessing each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ7547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Oligonucleotides (AAQ94201-094205) were synthesised for use as ligands. The ligands are covalently linked to a hapten (esp. a steroid hormone) to form a conjugate which is then immobilised on a solid support for interaction with antibodies against the hapten. Nucleic acid ligands are less likely to be recognised by the antibodies than are peptide ligands and nucleic acids are also less likely to undergo intramolecular organisation which interferes with accessibility of the hapten to the antibodies. For immunodiagnosis of oserradiol, the active hapten osestradiol-6-carboxymethoxime-N-hydroxysuccinimide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                     b "the glycosidic bonds between nucleotides are all in the alpha-anomer form"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Assay device for hapten or its specific antibodies - comprises support having competitive reagent immobilised via nucleic acid ligand to improve orientation and accessibility
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ;

```
A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AA075547-075798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction argyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Analysis of cDNA and gene expression - by amplification of mRNA followed by digestion with restriction enzymes
                                                                                                                                                                                                                                                                                                                                                                                                       Analysis; gene expression; reverse transcription; primer; cDNA; aggregate; restriction enzyme; ss.

A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENSSEQ files AAQ/7547-Q7759) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Analysis; gene expression; reverse transcription; primer; cDNA; aggregate; restriction enzyme; ss.

A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ7554-7075798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESE) (iles AAQ75547-0758) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression
              Analysis of cDNA and gene expression - by amplification of mRNA followed by digestion with restriction enzymes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Analysis; gene expression; reverse transcription; primer; cDNA; aggregate; restriction enzyme; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  amplification of mRNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Reverse transcription primer used in cDNA analysis technique.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily.

                                                                                                                                                                                                                                                                                                                                                                                        A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESE files AAQ75547-Q7598) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lames. The method can be used to analyse gene expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                          cDNA and gene expression - by amplification of mRNA digestion with restriction enzymes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Analysis of cDNA and gene expression - by amplification of mRNA followed by digestion with restriction enzymes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Analysis; gene expression; reverse transcription; primer; cDNA;

A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-Q7598) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoreaing the digested aggregate of cDNAs in seperate lames. The method can be used to analyse gene expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-Q7598) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQVIS-47-07598) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                               A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-Q758) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and, (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-Q7798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

                                                                               A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQVIS47-07758) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cNNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily.
                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           AAQ75571;
```

```
A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-Q75788) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lames. The method can be used to analyse gene expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Analysis of cDNA and gene expression - by amplification of mRNA followed by digestion with restriction enzymes
                                                                                                                                                                                                                                                                                                                                                                    Analysis; gene expression; reverse transcription; primer; cDNA; aggregate; restriction enzyme; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          .;

A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-Q759) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs

                                                                                                                                                                                                                                                                                                                                                                                                                                                                           A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENBSEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

The method can be used to analyse gene expression
                                                                                                                                                                               A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-Q7798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lames. The method can be used to analyse gene expression
                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

This oligonucleotide is used in the DNA cloning strategies of the Mycobacterium vaccae antigens. The invention provides M. vaccae polypeptides that comprise an immunogenic portion of a soluble M. vaccae antigen, or a variant, where the antigen induces an immune response in patients previously exposed to a mycobacterium. Such M. vaccae polypeptides can be used in methods for enhancing non-specific immune response. The methods and products can be used for the detection, tresponse. The methods and products can be used by mycobacteria such as M. vaccae, M. avium or M. tuberculosis. The products also have the ability to induce cell proliferation and cytckine products also have interferon-gamma and interleukin-12 production) in T cells, B cells, or macrophages. They can be used for enhancing immune responses for use in vaccines or immunotherapy of infectious diseases
                                                                                        Mycobacterium vaccae, antigen, therapy; prevention, cytokine production; M. avium; M. tuberculosis; immune response enhancer; cell proliferation; mycobacteria infection; vaccine; cancer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Oligonucleotide separated by capillary affinity gel electrophoresis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Mycobacterium vaccae polypeptides - used to develop products for in detection, therapy and prevention of mycobacteria infections as immune response enhancers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Capillary afinity gel electrophoresis; separation; polymer-gel;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Length 20;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

In an example, six antisense oligos were designed, TL-TG (AAT6360-55) and were compared to six oligos derived from other regions of HTLV-1, i.e. SJI (splice junction), Pl (PL), RI (rex), RRI (rex response element), El (env) and (Gl (gag), four reference oligonucleotides TIS (tax-sense), HC (GC20), HT (dT20) (AAT63647-49) and a random 20mer (RAN) in a HTLV-1 virus antigen expression inhibiting test. Oligonucleotide TI gave the best results.

process using capillary affinity gel electricably charget malecules brocess using capillary affinity gel electricably charget molecules relates to selective separation of electrically charget molecules in an analytical mixture. It comprises capillary affinity gel electrophoresis using a capillary tube which is at least partly filled with a polymer gel. Receptors for target molecules are covabently bound to the polymer. An electric field of at least 50 volts/cm is applied. The capillary tube is charged with the analytical mixture. In a first separation stage, the target molecules are covabently bound to the receptors and the remaining components are eluted, optionally whilst splitting open. In a second stage, the elution conditions are changed, optionally in stages, so that the alfinity of the target molecules for the receptor is eliminated and the target molecules are eluted and detected, optionally whilst splitting open. The process is useful for selective separation and/or determination of charged organic compounds, such as oligonucleotides, peptides or carbohydrates. It may be used, than brior art processes, especially in the case of complex biological analytical mixtures. It has high sensitivity, even with small amounts of samples. The derivatised polymers may be synthesised specifically using standard methods.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Mycobacterium vaccae protein, antigen, T cell activation, cytokine, dendritic cell maturation; infectious disease; immune disorder; cancer; respiratory system; mycobacterial infection; allergy, tuberculosis; leprosy, sarcoidosis; lung cancer; asthma; skin disorder; psoriasis; dermatitis; eczema; alopecia areata; skin cancer; basal carcinoma; squamous cell carcinoma; melanoma; PCR primer; ss.

The invention provides heat-killed Mycobacterium vaccae, or recombinant M. vaccae proteins. The M. vaccae proteins may be employed to activate considerable and natural killer cells, to stimulate the production of cytokines, to enhance the expression of co-stimulatory molecules on dendritic cells and monocytes, and to enhance dendritic cell maturation and function. The proteins can be expressed by standard recombinant methodology. Pharmaceutical compositions comprising the proteins or nucleic acid sequences encoding the proteins can be used for the treatment, prevention, and detection of discorders including infectious diseases, immune disorders and cancer. In particular, the compounds and methods are used for treatment of diseases of the respiratory system, such as mycobacterial infections, asthma, allergies, tuberculosis, capporiasis, atopic dermatitis, eczema, allergic contact dermatitis,

The invention relates to silyloxymethyl protected D- or L-ribonucleosides and their phosphonates (I), and silyloxymethyl halides (II). (I) are intermediates for synthesis of RNA-oligonucleotides with predetermined nucleotide sequence, particularly by machine synthesis. The groups specified above, apart from those on silyl, are those particularly for the cyanocthyl phosphoramidate coupling. Uses of the oligoribonucleotide products in diagnosis, therapy, and as research tools, are well known, and are not dealt with in detail. (II) is an intermediate for (I). The silyloxymethyl halide reagent is easy to prepare, and yields are high. Introduction of the silyloxymethyl group into the ribonucleoside is simple and rapid, and the acetal bond formed does not migrate, eliminating particularly the prior art problem of 2' to 3' isomerisation. The methylenedioxy group spacer between the silyl group and nucleoside is eliminating particularly the prior art problem of 2' to 3' isomerisation. The methylenedioxy group spacer between the silyl group and nucleoside linkages, enabling first, a range of choices for the silyloxy coupling. Purer products are therefore obtained than in prior art, and indian larger quantities and longer chains of oligoribonucleotides to the subhabelical and longer chains of oligoribonucleotides to
                                                                                                                                                                                                                                                                                   2-Silyloxymethyl ribonucleosides and their phosphonate derivatives - have high purity, use in machine synthesis of ribonucleic acids, enable longer oligonucleotide chain construction, and larger amounts
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 synthesised successfully, and in shorter times.
                                                                                                                                                                                                                                                                                                                                                                                            Example 6; Page 25; 38pp; English.

Quantitative analysis of a biochemical compound such as glucose, in body a body fluid such as blood, comprising detecting enhanced electron transfer between an oxidase and a DNA-immobilized electrode, useful for diagnosis of disease -

Example 1; Page 7; 14pp; English.

This invention describes a novel method for quantitatively analysing a biochemical compound (I) which comprises contacting (I) with double translated to the surface of an electrode at their terminals in which electrochemically active threading intercalators are intercalated, in an aqueous medium under application of electric potential to the electrode in the presence of an oxidase which oxidizes the biochemical compound and becomes reduced, and detecting electric current flowing between the electrode and a second electrode in the aqueous medium. The method is useful for detection of biochemical compounds such as glucose, cholesterol, urea nitrogen, bilirubin, uric acid, haemoglobin and lactic acid in body fluids such as whole blood, plasma, serum, urine, and lymph biochemical compounds quickly and easily with a high sensitivity using a simple apparatus. This sequence represents DNA fragment used as fixed probe DNA in the method of the invention.

containing 20 T nucleobases, 19 having a 2'-methoxyethoxy group
on its 5' ribosyl sugar moiety. It is an example of an oligomeric
compound produced according to the methods of the invention. The
invention provides compounds and methods for the preparation of
mixed backbone oligomeric, or chimeric, compounds having
thosphotochioate and/or phosphoramidate internucleoside linkages.
The methods also include incorporation of boranophosphate
internucleoside linkages. The methods utilise H-phosphonate
contiguous region is subsequently oxidized to phosphodiester,
phosphorothioate, phosphoramidate or boranophosphate
internucleoside linkages prior to further elongation. Mixed
backbone oligomeric compounds are prepared in this manner by
oxidizing adjacent regions with different reagents. Oligomeric
compounds of the invention are prepared using novel oxidation steps
that oxidize a region of 1 or more H-phosphonate internucleoside
linkages without degradating existing linkages that have been
previously oxidized. The oligonucleotides obtained are useful as
previously oxidized. The oligonucleotides obtained for other
the previously oxidized. The oligonucleotides obtained are useful as
previously oxidized.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Stem cell factor; SCF; haematopoietic progenitor cell; blood forming; primitive progenitor cell; haematopoietic disorder; syngeneic; allogeneic; autologous bone marrow transplant; gene therapy; transfection; haematopoietic stem cell; acute blood loss; neoplasia;

subject using progenitor cells and expanding the cells using stem cell

Example 3; Fig 12C; 123pp; English.

administration to a subject. The method comprises: (a) obtaining had administration to a subject. The method comprises: (a) obtaining cadministration to a subject. The method comprises: (a) obtaining to have made the admost of the primary structural specifically by adding to the cells a had admost of the primary structural confirmation and one or more of the blological properties of naturally occurring stem cell factor (SCF). The method is useful for stimulating primitive progenitor cells including early haematopoietic progenitor cells which are capable of maturing to erythroid, megakaryocyte, granulocyte, lymphocyte and macrophage cells. SCF results in absolute increases in haematopoietic cells of both myeloid and lymphoid lineages. SCF is useful for treating haematopoietic progenitors in syngeneic, allogeneic or autologous bone marrow transplant. SCF is useful for enhancing the efficiency of gene therapy based on transfecting haematopoietic stem cells. SCF is also useful for combating the myelosuppressive effects of anti-HIV drugs such as AZT and for enhancing the myelosuppressive progenitor acute blood loss and as a boost to the immune system for fighting neoplasia (cancer). The present sequence immune system for fighting neoplasia (cancer). The present sequence the present invention.

deministration to a subject. The method comprises: (a) obtaining has a subject or subject. The method comprises: (a) obtaining the manupoietic progenitor cells from a donor; and (b) expanding the cells did a demantopoietically effective dose of a polypeptide product having at least part of the primary structural confirmation and one or more of the biological properties of naturally confirmation and one or more of the biological properties of naturally primitive progenitor cells including early haematopoietic progenitor cells which are capable of maturing to erythroid, megakaryocyte, granulocyte, lymphocyte and macrophage cells. SCF results in absolute increases in haematopoietic cells of both myeloid and lymphoid lineages. SCF is useful for treating haematopoietic disorders. The method is useful for expanding early haematopoietic progenitors in syngeneic, allogeneic or autologous bone marrow transplant. SCF is useful for enhancing the efficiency of gene therapy based on transfecting haematopoietic stem cells. SCF is also useful for combating the myelosuppressive effects of anti-HIV drugs such as AZT and for enhancing haematopoietic recovery after acute blood loss and as a boost to the immune system for fighting neoplasia (cancer). The present sequence represents a universal oligonucleotide which is used in an example from the present invention. method has been developed of making haematopoietic cells suitable for subject using progenitor cells and expanding the cells using stem cell Production of hematopoietic cells suitable for administration to a Example 3; Fig 12C; 123pp; English. carry oligonuclectides complementary to at least 2 parts of (1), where detectable change caused by hybridisation of the oligonuclectide to (1) is observed. The method is used to detect (or to separate) specific (1), e.g. for diagnosing a wide variety of diseases, sequencing, in forensic oligonuclectivatised nanoparticles are also useful for preparing nanostructures useful, for example, as biochips, biofilters, mechanical devices, separation membranes, chemical sensors, in computers, and for drug delivery. Very stable nanoparticle-oligonuclectide conjugates can be produced, allowing their direct use (as probes) in polymerase chain reaction, i.e. they survive multiple heating/cooling cycles so not need to be added after amplification. (1) are detected by simple not med to be added after amplification. (1) are detected by simple repid field testing for e.g. pathogens. Ass63374-AAS63448 represent capid field testing for e.g. pathogens. Ass63374-AAS63448 represent

                                                                          The invention relates to novel saturated and unsaturated abjetane derivatives. The new compounds may be used directly or indirectly in the development of new diagnostic tests, to follow infections, especially viral infections, to follow and/or measure chemical products, especially potential pollutants. In diagnostic tests they may be used as markers, or to form a universal solid phase after immobilization on a solid support, to produce monoclonal antibodies or polyclonal antibodies having diagnostic uses. The oligonucleotides AAS91113-291117 represent examples of sequences that can be labeled with the new abletane derivatives. The new derivatives may be used to substitute for biotin in diagnostic tests, but because they are not found naturally in humans the risk of potential interactions with biological molecules is eliminated.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

Storhoff JJ, Elghanian R;

The specification describes a method for identifying a nucleic acid in a pool of interest. The method comprises pooling individually identifiable nucleic acids into at least two pools of one nucleic acid each; expressing nucleic acid pools to obtain protein expression product pools; assaying protein expression product pools for products having interaction with target molecule; selecting nucleic acid pools corresponding to identified protein expression product pools; and identifying individual nucleic acids in identified nucleic acid pools. The method is useful for identifying a nucleic acid (e.g. cDNA) in a pool of interest and for functionally screening several nucleic

Detecting a nucleic acid useful in e.g. diagnosing genetic, bacterial or viral diseases, by contacting the nucleic acid with oligonucleotides attached to nanoparticles and having sequences complementary a portion the nucleic acid

Example 24; Fig 44; 323pp; English

The sequence represents a cyclic disulphide linked oligonucleotide which may be coupled with colloidal gold particles (nanoparticles) and used to demonstrate the method of the invention. The invention relates to isolating or detecting a nucleic acid of interest, in a mixture of nucleic acids, by binding it to 2 or more complimentary nucleotides which have a nanoparticle attached to their 5' ends. The nanoparticles (e.g. colloidal gold) are used to both isolate and detect (e.g. by linking the particle to a fluorescent probe) the resultant complex. The methods are useful for detecting nucleic acids, natural or synthetic, and modified or unmodified. The methods may also be applied in the diagnosis of genetic,

labeling or modifying RNA 3'-termini using DNA polymerase and a synthetic template with defined overhang nucleotides.

Sequence 20 BP; 0 A; 0 C; 0 G; 20 T; 0 other;

The sequence represents a synthetic DNA template molecule used to demonstrate the method of the invention. The invention relates to a method of modifying (e.g. 3' end labelling with 32P dAPP) the 3' terminus of an RNA molecule by providing a DNA oligonucleotide, complimentary to the 3' end of the RNA molecule, with an overhang at the 5' end which allows incorporation of the labeling nucleotide into the RNA molecule. The method, based on the synthesis of Okazaki fragments, is useful for labeling and modifying the 3'-termini of other nucleic acids such as DNA fragments. The method is a simple and efficient way of

bacterial and viral diseases, in forensics, in DNA sequencing, for the ready. The methods are further authentication, and for monitoring gene therapy. The methods are further useful in research and analytical laboratories in DNA sequencing, in the field to detect the presence of specific pathogens, for quick identification of an infection to assist in drug prescription, and in homes and health centres for inexpensive drug prescription, and in homes and health centres for inexpensive colour change with the methods, which are based on observing colour change with the naked eye, are cheap, fast, simple, robust (reagents are stable), do not require specialised or expensive equipment,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Modifying a 3' terminus of a pre-selected DNA sequence, useful for labeling and modifying 3'-termini of other nucleic acids, comprises using a synthetic nucleotide template with a defined overhang nucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      3' RNA end labeling; DNA template; Okazaki fragment; 5' overhang;

The present sequence for universal PCR primer 220-3 is 1 of 19
PCR primers (AAS1043-AAS10453) used to amplify various portions of
the human SCF CDNA sequence. The sequence is described in an
invention relating to novel stem cell factors, the polynucleotides
encoding them and methods for producing the stem cell factors. The
methods involve increasing the number of early hematopoietic progenitor
cells in human peripheral blood by administering a haematopoietically
the treatment of blood disorders, including myelofibrosis,
myelosclerosis, osteopetrosis, metastatic carcinoma, acute leukaemia,
multiple myeloma, Hodgkin's disease, lymphoma, Gaucher's disease,
Niemann-Pick disease, refractory anaemia, witamin B12 and folic
acid deficiency, hypopigmentation disorders i.e. piebaldism and viral
induced disorders, including AIDS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Increasing the number of early haematopoietic progenitor cells in the peripheral blood useful for the treatment of blood disorders including Hodgkin's disease comprises the administration of human stem cell

The present sequence for universal PCR primer 220-11 is 1 of 19 PCR primers (AAS10435-AAS10453) used to amplify various portions of the human SCF CDNA sequence. The sequence is described in an invention relating to novel stem cell factors, the polymucleotides encoding them and methods for producing the stem cell factors. The methods involve increasing the number of early haematopoietic progenitor cells in human peripheral blood by administering a haematopoietically effective human stem cell factor polypeptide. The methods are useful for the treatment of blood disorders, including myelofibrosis, myelosclerosis, osteopetrosis, metastatic carcinoma, acute leukaemia,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                multiple myeloma, Hodgkin's disease, lymphoma, Gaucher's disease, Niemann-Pick disease, refractory anaemia, malaria, vitamin B12 and folicacid deficiency, hypopigmentation disorders i.e. piebaldism and viral
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Increasing the number of early haematopoietic progenitor cells in the peripheral blood useful for the treatment of blood disorders including Hodgkin's disease comprises the administration of human stem cell

The present invention describes a method for enhancing (E) the efficiency of transfer of a polynucleotide (I) into a target mammalian feal. (II) in vitro, comprising exposing (II) that expresses a stem cell fragment, which induces cell proliferation, and introducing (I) to (II) in vitro. Exposure of SCF to (II) results in increased uptake of (II) into the cell. The method is useful for enhancing the efficiency of the transfer of a polynucleotide into a target mammalian cell in vitro. The method is useful in gene therapy techniques. AAH41301 to AAH41364 and AAB98351 to AAB98190 represent sequences used in the exemplification of the present invention.

The method comprises phosphitylating the 5'-hydroxyl of a nucleic acid group having at least one nucleoside with a 2' modification in an actonitrile. The present sequence was used to illustrate the method of the present invention. The method is useful for synthesising sulphurised 2' substituted phosphorothioate oligomuclectides, which may be used in molecular biological research, in applications such as anti-viral therapy, and for determining the stereochemical pathways of certain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Preparing sulfurized 2' substituted phosphorothicate oligonucleotides useful in biological research, comprises phosphitylating the 5'-hydroxyl of a nucleic acid having a nucleoside with a 2'

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes a method for enhancing (E) the efficiency of transfer of a polynucleotide (I) into a target mammalian facil (II) in vitro, comprising exposing (II) that expresses a stem cell factor (SCE) receptor to a biologically active SCF, its analogue or fragment, which induces cell proliferation, and introducing (I) to (II) in vitro. Exposure of SCF to (II) results in increased uptake of (I) into the cell. The method is useful for enhancing the efficiency of the transfer of a polynucleotide into a target mammalian cell in vitro. The method is useful in gene therapy techniques. AAH41301 to AAH41364 and AAB98351 to AAB98390 represent sequences used in the exemplification

universal oligomucleotides (Asodallo-Asodall) used in the isolation of the human SCF (stem cell factor) cDNA sequence. The present invention relates to novel stem cell factors can be seen invention relates to novel stem cell factors (AAU02453-AAU02458, AAU02460, AAU02400 stem cell factors cancoding them. SCF stimulate primitive progenitor cells including early haematopoietic progenitor cells. The invention also describes SCF (AAU02462-AAU02481) and the oligomucleotides (AAU02462-AAU02481) and the oligomucleotides (AAU02462-AAU02481) and the solation of human and rat SCF sequences. The polynucleotide encoding SCF is useful for producing SCF and useful in gene therapy. It is useful for treating disorders involving blood cells such as myelofibrosis, metastatic carcinoma, acute leukaemia, multiple myelogibrosis, disease, lymphoma, Gaucher's disease, anaemia, congestive splenomegaly, Kala azar, Gaucher's disease, anaemia, congestive splenomegaly, Kala azar, Fulminating septicemia, malaria, vitemin Bl2 and folic acid deficiency, pyridoxine deficiency, and hypopigmentation disorders such as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel nucleic acids encoding stem cell factor useful for treating disorders involving blood cells, e.g. leukaemia, splenomegaly, Hodgkin's disease, Kala azar, anaemia and septicemia -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human, stem cell factor; SCF; early haematopoietic progenitor cell;

The present sequence for universal PCR primer 220-3 is 1 of 8 universal oligomucleotides (AAS04211-AAS04218) used in the isolation of the human SCF (stem cell factor) CDNA sequence. The present invention relates to novel stem cell factors (AAU02761-AAU02767, AAU02775, AAU02797) and the polymucleotides encoding them. SCF stimulate primitive progenitor cells including early haematopoietic progenitor cells. The invention also describes SCF peptides (AAU02777-AAU02794) and the oligomucleotides (AAS04182-AAS04210) used in the isolation of human and rat SCF
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    sequences. The polymicleotide encoding SCF is useful for producing SCF and useful in gene therapy. It is useful for treating disorders involving blood cells such as myelofibrosis, metastatic carcinoma, acute leukaemia, multiple myeloma, Hodgkin's disease, lymphoma, gaucher's disease, anaemia, congestive splenomegaly, Kala azar, sarcoidosis, military tuberculosis, diseeminated fungus disease, Fulminating septicemia, malaria, vitamin B12 and folic acid deficiency, pyridoxine deficiency, and hypopigmentation disorders such as piebaldism and vitiligo.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human, stem cell factor; SCF; early haematopoietic progenitor cell; blood disorder; leukaemia; Hodgkin's disease; lymphoma; splenomegaly; anaemia; Kala azar; septicemia; malaria; hypopigmentation disorder;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence for universal PCR primer 220-11 is 1 of 8
universal oligonucleotides (AASO4110-AASO4117) used in the
isolation of the human SCF stem cell factor. DNA sequence. The
present invention relates to novel stem cell factors

(AAU02453-AAU02458, AAU02460, AAU02461) and the polynucleotides
cncoding them. SCF stimulate primitive progenitor cells including early
haematopoletic progenitor cells. The invention also describes SCF
peptides (AAV02462-AAV07481) and the oligonucleotides

(AASO4081-AASO4117) used in the isolation of human and rat SCF
sequences. The polynucleotide encoding SCF is useful for producing
caute leukaemia, multiple myeloma, Hodgkin's disease, lumphoma,
acute leukaemia, multiple myeloma, Hodgkin's disease, lumphoma,
daucher's disease, anaemia, congestive splenomegaly, Kala azar,
Gaucher's disease, anaemia, congestive splenomegaly, Kala azar,
Caucher's military tuberculosis, disseminated fungus disease,
Fulminating septicemia, malaria, vitemin B12 and folic acid deficiency,
pyridoxine deficiency, and hypopigmentation disorders such as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ;

The present sequence for universal PCR primer 220-11 is 1 of 8 universal oligomucleotides (AAS04218) used in the isolation of the human SCF (stem cell factor) cDNA sequence. The present invention relates to novel stem cell factors

(AAU02761-AAU02767, AAU02770-AAU02775, AAU02797) and the polynucleotides cancoding them. SCF stimulate primitive progenitor cells including early haematopoietic progenitor cells. The invention also describes SCF (ARS04182-AAS04210) used in the isolation of human and rat SCF sequences. The polynucleotide encoding SCF is useful for producing SCF and useful in gene therapy. It is useful for treating disorders involving blood cells such as myelofibrosis, metabetatic carcinoma, acute leukaemia, multiple myeloma, Hoddytin's disease, lymphoma, gaucher's disease, anaemia, congestive splenomegaly, Kala azar, sanchosis, military tuberculosis, disseminated fungus disease, ruliminating septicemia, malazia, vitamin B12 and folic acid deficiency, signal and hypopigmentation disorders such as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human, stem cell factor; SCF; early haematopoietic progenitor cell;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence for universal PCR primer 220-3 is 1 of 8 universal oligonucleotides (AAH23888-AAH23895) used in the isolation of the human SCF (Stem cell factor) cDNA sequence. The present invention relates to novel stem cell factors (AAB73561-AAB73568, AAB73571-AAB73576) and the polynucleotides encoding them. SCF stimulate primitive progenitor cells including especial progenitor cells. The invention also describes SCF peptides (AAB73578-AAB73597) and the oligonucleotides (AAB73578-AAB73597) and the oligonucleotides (AAB7389-AAB73897) used in the isolation of human and rat SCF sequences. The polynucleotide encoding SCF is useful for producing family useful in gene therapy. It is useful for treating disorders involving blood cells such as myelofibrosis, metastatic carcinoma,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        .,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human SCF (stem cell factor) cDNA universal PCR primer 220-11.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Length 20;

universal oligonucleotides (AAH23895) used in the isolation of the human SCF (stem cell factor) CDNs sequence. The present invention relates to novel stem cell factor) CDNs sequence. The present invention relates to novel stem cell factors (AAB73561, AAB73576) and the polynucleotides (AAB73561, AAB73577). AAB73577 and the polynucleotides encoding them. SCF stimulate primitive progenitor cells including early hamatopoletic progenitor cells. The invention also describes SCF peptides (AAB73578-AAB73597) and the oligonucleotides (AAH23897) used in the isolation of human and rat SCF sequences. The polynucleotide encoding SCF is useful for producing SCF and useful in gene therapy. It is useful for treating disorders involving blood cells such as myelofibrosis, metastatic carcinoma, cut leukamia, multiple myeloma, disease, lymphoma, daucher's disease, anaemia, congestive splenomegally, Kala azar, sarcoidosis, military tuberculosis, disseminated fungus disease, printinating septiceamia, malaria, vitamin B12 and folic acid deficiency, pyridoxine deficiency, and hypopigmentation disorders such as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Vaccine, cytostatic; virucidal; bactericidal; fungicidal; anti-parasitic; immunostimulatory; tumour; viral infection; bacterial infection; fungal infection; parasitic infection; cancer; asthma; infectious disease; allergy; immune deficiency; phosphorothioate; ss.
                                                                                                                                                                                                                                                                                            New stem cell factor polypeptides and their analogs which stimulate growth of early hematopoietic progenitors, useful for treating aplastic anemia, carcinoma, multiple myeloma, vitiligo, kala azar, Hodgkin's

The present invention relates to a method for stimulating an immune response. The method comprises administering an immunostimulatory nucleic acid to a non-rodent subject in sufficient quantity to stimulate an immune response. The present sequence is one such immunostimulatory nucleic acid. The immunostimulatory nucleic acids can be pyrimidine rich against tumour antigens, viral antigens (e.g. herpesviridae, retroviridae and/or orthomyxoviridae), bacterial antigens (e.g. toxoplasma, haemophilus, campylobacter, clostridium, Escherichia coli and/or staphylococus), fungal antigens and/or parasitic antigens. The method is also useful for preventing cancer, asthma, infectious disease, allergy or immune deficiency. The present sequence can also be used to redirect a Thi to a Thi immune response and to activate immune cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        anti-parasitic;

The present invention relates to a method for stimulating an immune response. The method comprises administering an immunostimulatory nucleic acid to a non-rodent subject in sufficient quantity to stimulate an immune response. The present sequence is one such immunostimulatory nucleic acid. The immunostimulatory nucleic acids can be pyrimidine rich (py-rich) or thymidine (r) rich. The method is used to vaccinate subjects against tumour antigens, viral antigens (e.g. herpesviridae, retroviridae and/or orthomyxoviridae), bacterial antigens (e.g. toxoplasma, hemophilus, campylobacter, clostridium, Bscherichia coli and/or staphylococcus), fungal antigens and/or parasitic antigens. The method is also useful for preventing cancer, asthma, infectious disease, allergy or immune deficiency. The present sequence can also be used to redirect a fine to a Thl immune response and to activate immune cells.

Note: the present sequence may have a phosphorothioate backbone.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This invention describes a novel conjugate (I) which consists of (A) a molecule to be transported and (B) at least one aryl residue of formula -A\mathbf{r}-(\mathbf{X}-C(\mathbf{Y})-\mathbf{R}_1) n (II). Ar = group containing at least one aromatic ring; X = 0 or \overline{\mathbf{N}} (sic); Y = 0, S or NH-R 2 (sic); R_1 = optionally substituted 1-23C alkyl (optionally containing dowble and/or triple bonds); R_2 = optionally substituted 1-18C alkyl (optionally containing double and/or triple bonds); n = integer of 1 or more. (A) is bonded to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Transport; membrane; cytostatic; virucide; vasotropic; dermatological; antipsoriatic; antiasthmatic; gene therapy; tumor cell; antisense; tumor therapy; drug; phosphodiester linkage; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                             The present invention relates to a method for stimulating an immune response. The method comprises administering an immunostimulatory nucleic acid to a non-rodent subject in sufficient quantity to stimulate an immune response. The present sequence is one such immunostimulatory nucleic acids. The immunostimulatory nucleic acids can be pyrimidine rich (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects against tumour antigens, viral antigens (e.g. herpesviridae, retroviridae and/or orthomyxcoviridae), bacterial antigens (e.g. toxoplasma, haemophilus, campylobacter, clostridium, Escherichia coli and/or staphylococcus), fungal antigens and/or parasitic antigens. The method is also useful for preventing cancer, asthma, infectious disease, allergy or immune deficiency. The present sequence can also be used to redirect a Thi immune response and to activate immune cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Vaccine, cytostatic, virucidal, bactericidal, fungicidal, anti-parasitic, immunostimulatory, tumour; viral infection, bacterial infection; fungal infection; parasitic infection; cancer, asthms; infectious disease; allergy, immune deficiency; phosphorothioate; ss.

the directly or via a chemical group, provided that the chemical group is other than CH 2-S if the bond is via a phosphodiester linkage of (A). The invention also describes (i) the preparation of a conjugate (I') of (A') a molecule to be transported and (B') at least one aryl residue (not creatized to (II)), by preparing (A') containing a reactive function at the position at which (B') is to be bonded, preparing (B') and reacting (A') and (B'); and (ii) the use of aryl groups (II) (optionally bonded (C') at a chemical group) for transporting (A) across biological membranes. The products of the invention have cytostatic, virucide, vasorropic, corresponding of the invention have cytostatic, virucide, vasorropic, corresponding of the invention have cytostatic, virucide, vasorropic, corresponding (A) across biological membranes or into eukaryotic or prokaryotic cells (A) across biological membranes or into eukaryotic or prokaryotic cells (A) across biological membranes or into eukaryotic or prokaryotic cells, containing (I) are also claimed. Typically (I) are also claimed. Typically (I) are also claimed. Typically (I) are antisense or into the transporting or cells. Medicaments, diagnostic agents and test kits containing (I) are also claimed. Typically (I) are antisense or inference for tunor therapy, oligonucleotide drivatives for transing viral infections or diseases associated with integrins or cellicallization. Conjugates for in vivo diagnostic use, e.g. by in situ or hybridization. Conjugates for in vivo diagnostic use, e.g. by in situ collications or diseases associated with integrins or cellular uptake etc. The capital are uptake etc. The capital of cellular uptake conjugated with fluorescein derivative residues, cellular uptake to corresponding fluorescein centurated (II); e.g. oligonucleotides conjugated with fluorescein derivative to that obtained using other conjugated vith fluorescein derivative r conjugates.

Preparing novel deoxynucleic alkyl thiourea oligonucleotide for use in

The present sequence was used to demonstrate the ability of decxynucleic S-Methythiourea (DNMt) compounds to form triplexes with DNA oligomers. An increase in the C content of the oligos realized in a large decrease in binding. This experiment was performed as an example of a method for preparing oligomucleotides comprising a backbone of alkyl or alkoxy thiourea linkages. The method is useful for preparing oligomucleotides for use in antisense or antigene therapy, to inhibit production of proteins associated with genetic diseases, cardiovascular, inflammatory and neurocellular diseases, and for antivirus therapy, e.g. to treat human immunodeficiency virus, human-cytomegalovirus, influenza and to detect the presence or absence of the target DNA or RNA sequences to which they specifically bind and by antagonising the normal biological cuissue e.g. tissue differentiation, both in vivo and in ex vivo tissue cultures. The method provides an efficient and rapid solid-phase method for the synthesis of thiourea and S-methylthiourea. 0 by synthesizing oligonuclectides comprising backbone thiourea linkages in solution or on solid phase -Gaps 0; 1.5%; Score 17; DB 1; Length 20; 100.0%; Pred. Detecting nucleic acid, useful for e.g. diagnosis of diseases, forensics and DNA sequencing, comprises observing detectable change

```
The present sequence is an oligonuclectide used in a method for detecting a nucleic acid having at least 2 portions. The method comprises hybridising the nucleic acid with oligonuclectides, such as the present sequence, attached to a substrate and/or particle and detecting a change in colour, conductivity or optical density. The method is useful for the diagnosis and/or monitoring of diseases, in forensics, in DNA sequencing, for paternity testing, for cell line authentication and for monitoring gene therapy. Detecting nucleic acids based upon observing a colour change is cheap, fast, simple, and does not require specialised or expensive equipment. The nanoparticle oligonucleotide conjugates remain stable for at least 6 months. A single base mismatch and as little as 20 femtomoles (fM) of target can be detected using the conjugates.
brought about by hybridization of nucleic acid with substrate or particle bound oligonucleotides -

The invention relates to the use of an immunostimulatory single-stranded DNA-binding protein in screening assays to identify compounds which bind to it and thereby act as functional modifiers of immunostimulatory oligodeoxynucleotide (ODN) activity. Such modifiers of ODN activity. Such modifiers of ODN activity consist of immunostimulatory DNA binding inhibitors, immunostimulatory DNA agonists and artagonists. Immunostimulatory DNA agonists and artagonists. Immunostimulatory DNA-binding proteins can also be used in screening methods to identify immunostimulatory DNA binding protein competed and to optimize an immunostimulatory ODN for immune stimulation. Isolated complexes of an immunostimulatory DNA-binding protein bound to an immunostimulatory ODN for immunostimulatory ODN can additionally be used to screen a panel of candidate target molecules to identify the cellular target molecules of the invention are the RNA-binding proteins used in the methods of the invention are the RNA-binding proteins methods are useful for identifying a compound that inhibits interaction methods are useful for identifying a compound that inhibits interaction protein and for identifying agonists useful in immunostimulatory DNA and immunostimulatory DNA binding protein and for identifying agonists useful in immunostimulatory DNA cellular target complex is useful in screening for immunostimulatory DNA cellular target increasing in the immunostimulatory DNA collular target increasing the immunostimulatory DNA by complex is useful in screening for immunostimulatory DNA cellular target increasing the immunostimulatory DNA cellular target increasing the immunostimulatory DNA by complex is useful in screening for immunostimulatory DNA cellular target increasing the immunostimulatory DNA by immunostimulatory DNA cellular target increasing the immunostimulatory DNA cellular target inc

The present invention provides the protein and coding sequences of mammalian stem cell factors (SCFs). These are capable of stimulating the growth of early haematopoietic progenitor cells, neural stem cells and primordial garm stem cells. The sequences are useful in the treatment of leukaemias, haematopoietic disorders, aplastic anaemia, paroxysmal nocturnal haemoglobinuria, malaria, pigmentation disorders, neurological and intestinal damage, infertility, AIDS and severe combined immunodeficiency (SCID). The present sequence is primer used to amplify an SCF in the exemplification of the invention.
                                        Novel isolated non-human mammalian stem cell factor polypeptide stimulating growth of early haematopoietic progenitor cells, useful for treating aplastic anaemia, lymphoma, Letterer-Siwe disease, Kala azar,

The present invention provides the protein and coding sequences of mammalian stem cell factors (SCFS). These are capable of stimulating the growth of early haematopoietic progenitor cells, neural stem cells and primordial germ stem cells. The sequences are useful in the treatment of leukaemias, haematopoietic disorders, aplastic anaemia, paroxysmal nocturnal haemoglobinuxia, malaria, pigmentation disorders, neurological and intestinal damage, infertility, AIDS and severe combined immunodeficiency (SCID). The present sequence is primer used to amplify an SCF in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to an array of proteins (antibody minics) comprising a fibronectin type III domain having a randomised loop, a bind tearsheet, or their combination, and has the capacity to bind to a compound that is not bound by a corresponding naturally-occurring fibronectin, immobilised onto a solid support. The antibody mimics is useful for detecting a compound preferably a protein, in a biological sample. It is also useful to detect one or more different analytes simultaneously in a sample. Hence is useful for diagnostic purposes. It is also useful for the purpose of designing proteins capable of binding to virtually any compound of interest. The present sequence is a capture probe used to self-assemble and anchor the tenth module of human fibronectin module of type III (Fn3) (10Fn3) which is used in an exemplification of the invention.
                                                                                                                                                                                                                                                                                            Gaps

Production of a human stem cell factor (SCF) polypeptide for treating disorders involving blood cells, such as leukaemia, comprises culturing mammalian cells comprising non-human SCF promoter DNA linked to DNA
multiple myeloma; Hodgkin's disease; lymphoma; malaria; vitiligo; refractory erythroblastic anaemia; miliary tuberculosis; cytostatic; disseminated fungus disease; haematopoietic; tuberculostatic; antianaemic; antifungal; antimalarial; dermatological; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         polymorlectide sequences encoding the SCFS, and methods of producing them. SCFs are involved in the blood-forming (haematopoietic) superior are involved in the blood-forming (haematopoietic) is useful for the production of humans. The method of the invention is useful for treat disorders involving blood cells e.g. metastatic carcinoma, acute leukaemai, multiple myeloma, Hodgkin's disease, lymphoma, refractory erythroblastic anaemia, miliary tuberculosis, disseminated fungus disease, malaria, and vitiligo. The present used in the examples of the present invention.
